

Abstract of the Disclosure

Hydraulically Actuated Quick Coupling Device

- 5           An attachment frame is connected with a loader arm of a work machine for connecting an implement thereto. A latch member is operatively associated with the attachment frame and movable between a disengaged position and an engaged position.
- 10   A link has a first end portion connected to the latch member and a second end portion. A pivot member has a first end portion pivotally connected on the attachment frame, a second end portion pivotally connected on the second end portion of the link, and a
- 15   central portion. A cylinder has a head end portion connected to the attachment frame and a rod end portion connected to the central portion of the pivot member. The cylinder is connected with a supply of hydraulic fluid so that upon pressurization thereof
- 20   the cylinder is actuated for moving the latch member between the disengaged and engaged positions to respectively detach and attach the implement to the work machine.
